

# Data Mining (EECS 6412)

---

## Sequential Pattern Mining

Aijun An

Department of Electrical Engineering and Computer Science  
York University

## Outline

- ▶ Basic concepts of sequential pattern mining
- ▶ A Simplified Version of GSP Algorithm
- ▶ PrefixSpan

## An Example Sequence Database

Customer Id	TransactionTime	Items Bought
1	June 25 '03	30
1	June 30 '03	90
2	June 10 '03	10, 20
2	June 15 '03	30
2	June 20 '03	40, 60, 70
3	June 25 '03	30, 50, 70
4	June 25 '03	30
4	June 30 '03	40, 70
4	July 25 '03	90
5	June 12 '03	90

Figure 1: Database Sorted by Customer Id and Transaction Time

Customer Id	Customer Sequence
1	{(30) (90)}
2	{(10 20) (30) (40 60 70)}
3	{(30 50 70)}
4	{(30) (40 70) (90)}
5	{(90)}

Figure 2: Customer-Sequence Version of the Database

- ▶ A *sequence database* consists of a set of sequences
- ▶ A *sequence* is an ordered list of itemsets
- ▶ *Itemset*: a set of items
- ▶ Items within an itemset are unordered.
- ▶ *Element*: an itemset in a sequence

3

## Example of a Sequential Pattern

- ▶ Database of an online book store
  - ▶ Contains data sequences
  - ▶ Each sequence corresponds to a list of transactions by a given customer.
  - ▶ Each transaction contains the books selected by the customer in one order.
- ▶ A sequential pattern
  - ▶ 5% of customers bought “*Foundation*”, then “*Foundation and Empire*” and “*Ringworld*”, then “*Second Foundation*”.
- ▶ Usefulness
  - ▶ Making recommendations.
  - ▶ Knowing what to stock.

4

# Mining Sequential Patterns

- ▶ Objective
  - ▶ Finding (interesting) frequent sequences from a sequence database.
- ▶ Applications
  - ▶ Customer shopping sequence analysis
  - ▶ Web log analysis
  - ▶ DNA or protein analysis
  - ▶ Stock market analysis
  - ▶ Medical domain
    - ▶ Predict onset of a disease from a sequence of symptoms, etc.
  - ▶ Earthquake prediction
  - ▶ etc.

5

## Basic Concepts

- ▶ A sequence  $\langle a_1, a_2, \dots, a_n \rangle$  *is contained in* (or *is a subsequence of*) another sequence  $\langle b_1, b_2, \dots, b_m \rangle$  if there exist integers  $i_1 < i_2 < \dots < i_n$  such that  $a_1 \subseteq b_{i_1}, a_2 \subseteq b_{i_2}, \dots, a_n \subseteq b_{i_n}$ .
  - ▶ E.g.,  $\langle (3) (4\ 5) (8) \rangle$  is contained in  $\langle (7) (3\ 8) (9) (4\ 5\ 6) (8) \rangle$
- ▶ *Support of a sequence* is defined as the fraction of total sequences in the database that contains this sequence.
  - ▶ Support of  $\langle (30) (90) \rangle$ ?
  - ▶ Support of  $\langle (20) (60\ 70) \rangle$ ?
  - ▶ Support of  $\langle (30)(70) \rangle$ ?
- ▶ *Frequent sequences* (also called *sequential patterns*)
  - ▶ sequences that satisfy a minimum support (min\_sup).

Customer Id	Customer Sequence
1	$\langle (30) (90) \rangle$
2	$\langle (10\ 20) (30) (40\ 60\ 70) \rangle$
3	$\langle (30\ 50\ 70) \rangle$
4	$\langle (30) (40\ 70) (90) \rangle$
5	$\langle (90) \rangle$

6

## Sequential Pattern Mining

- ▶ What is sequential pattern mining
  - ▶ Given a sequence database, find the set of frequent sequences that satisfy a minimum support (min\_sup).
- ▶ Algorithms
  - ▶ Initial Apriori-like algorithms (Agrawal and Srikant, 95)
    - ▶ AprioriAll, AprioriSome, and DynamicSome
  - ▶ GSP - an Apriori-like, influential mining method (Srikant and Agrawal, 96)
  - ▶ PrefixSpan (Pei, et al, 01)
  - ▶ SPADE (Zaki, 01)
  - ▶ Mining sequential patterns with constraints (Pei, et al, 02)
  - ▶ etc.

7

## Apriori Property

- ▶ The **Apriori** property in sequential patterns:  
Any nonempty subsequence of a frequent sequence must be frequent
  - ▶ If a sequence is infrequent, then none of its super-sequences is frequent.
  - ▶ i.e., if  $\langle (3) (4\ 5) \rangle$  is infrequent, so are  $\langle (3) (4\ 5) (8) \rangle$  and  $\langle (3\ 6) (4\ 5) \rangle$

8

## GSP

- ▶ GSP: Generalized Sequential Pattern Mining
- ▶ Proposed in
  - ▶ R. Srikant and R. Agrawal. Mining Sequential Patterns: Generalizations and Performance Improvements. In Proc. of EDBT'96.
  - ▶ Can be downloaded from the course web site
- ▶ GSP considers some time constraints and item taxonomy
  - ▶ More general than simply mining sequential patterns

9

## A Simplified Version of GSP

- ▶ GSP without the generalizations
- ▶ Problem statement:
  - ▶ find all frequent sequences from a database of sequences given a *min\_sup*
- ▶ Length of a sequence = number of items in the sequence
  - ▶ Length of  $\langle(a)(b)\rangle$  is 2
  - ▶ Length of  $\langle(a\ b)\rangle$  is 2
  - ▶ Length of  $\langle(a\ b)\ (c)\rangle$  is 3
- ▶ A *length-k sequence* is also called *k-sequence*.

10

## General Description of Simplified GSP

### ► Method

- Take sequences in form of  $\langle(x)\rangle$  as length-1 candidates
- Scan database once, find  $L_1$ , the set of length-1 sequential patterns
- Let  $k=1$ ; while  $L_k$  is not empty do
  - **Form**  $C_{k+1}$ , the set of length- $(k+1)$  **candidates** from  $L_k$ ;
  - If  $C_{k+1}$  is not empty, **scan database** once, find  $L_{k+1}$ , the set of length- $(k+1)$  sequential patterns
  - Let  $k=k+1$ ;

11

## Finding Length-1 Sequential Patterns

### ► Initial candidates

- $\langle(a)\rangle, \langle(b)\rangle, \langle(c)\rangle, \langle(d)\rangle, \langle(e)\rangle, \langle(f)\rangle, \langle(g)\rangle, \langle(h)\rangle$

### ► Scan database once

- count support for candidates

$min\_sup = 40\%$

$min\_sup\_count = 2$

Seq-id	Sequence
10	$\langle(bd)(c)(b)(ac)\rangle$
20	$\langle(bf)(ce)(b)(fg)\rangle$
30	$\langle(ah)(bf)(a)(b)(f)\rangle$
40	$\langle(be)(ce)(d)\rangle$
50	$\langle(a)(bd)(b)(c)(b)(ade)\rangle$

Cand	Sup
$\langle(a)\rangle$	<b>3</b>
$\langle(b)\rangle$	<b>5</b>
$\langle(c)\rangle$	<b>4</b>
$\langle(d)\rangle$	<b>3</b>
$\langle(e)\rangle$	<b>3</b>
$\langle(f)\rangle$	<b>2</b>
<del><math>\langle(g)\rangle</math></del>	1
<del><math>\langle(h)\rangle</math></del>	1

12

## Length-2 Candidate Generation

- ▶ How to generate  $C_2$  from  $L_1$ 
  - ▶ Merge every pair of frequent length-1 sequences.
  - ▶ Merging two frequent length-1 sequences  $\langle i_1 \rangle$  and  $\langle i_2 \rangle$  will produce three candidate 2-sequences:
 
$$\langle (i_1) (i_2) \rangle \quad \langle (i_2) (i_1) \rangle \text{ and } \langle (i_1 i_2) \rangle$$
 assuming that  $i_1$  is different from  $i_2$ .
  - ▶ Every frequent length-1 sequence  $\langle i \rangle$  can join with itself to produce  $\langle (i)(i) \rangle$ .

13

## Length-2 Candidates (Cont'd from the example on Slide 13)

Length of a sequence = the number of items

51 length-2 Candidates

	$\langle a \rangle$	$\langle b \rangle$	$\langle c \rangle$	$\langle d \rangle$	$\langle e \rangle$	$\langle f \rangle$
$\langle a \rangle$	$\langle (a)(a) \rangle$	$\langle (a)(b) \rangle$	$\langle (a)(c) \rangle$	$\langle (a)(d) \rangle$	$\langle (a)(e) \rangle$	$\langle (a)(f) \rangle$
$\langle b \rangle$	$\langle (b)(a) \rangle$	$\langle (b)(b) \rangle$	$\langle (b)(c) \rangle$	$\langle (b)(d) \rangle$	$\langle (b)(e) \rangle$	$\langle (b)(f) \rangle$
$\langle c \rangle$	$\langle (c)(a) \rangle$	$\langle (c)(b) \rangle$	$\langle (c)(c) \rangle$	$\langle (c)(d) \rangle$	$\langle (c)(e) \rangle$	$\langle (c)(f) \rangle$
$\langle d \rangle$	$\langle (d)(a) \rangle$	$\langle (d)(b) \rangle$	$\langle (d)(c) \rangle$	$\langle (d)(d) \rangle$	$\langle (d)(e) \rangle$	$\langle (d)(f) \rangle$
$\langle e \rangle$	$\langle (e)(a) \rangle$	$\langle (e)(b) \rangle$	$\langle (e)(c) \rangle$	$\langle (e)(d) \rangle$	$\langle (e)(e) \rangle$	$\langle (e)(f) \rangle$
$\langle f \rangle$	$\langle (f)(a) \rangle$	$\langle (f)(b) \rangle$	$\langle (f)(c) \rangle$	$\langle (f)(d) \rangle$	$\langle (f)(e) \rangle$	$\langle (f)(f) \rangle$

	$\langle a \rangle$	$\langle b \rangle$	$\langle c \rangle$	$\langle d \rangle$	$\langle e \rangle$	$\langle f \rangle$
$\langle a \rangle$		$\langle (ab) \rangle$	$\langle (ac) \rangle$	$\langle (ad) \rangle$	$\langle (ae) \rangle$	$\langle (af) \rangle$
$\langle b \rangle$			$\langle (bc) \rangle$	$\langle (bd) \rangle$	$\langle (be) \rangle$	$\langle (bf) \rangle$
$\langle c \rangle$				$\langle (cd) \rangle$	$\langle (ce) \rangle$	$\langle (cf) \rangle$
$\langle d \rangle$					$\langle (de) \rangle$	$\langle (df) \rangle$
$\langle e \rangle$						$\langle (ef) \rangle$
$\langle f \rangle$						

Without Apriori property,  
 $8 * 8 + 8 * 7 / 2 = 92$   
 candidates  
**Apriori prunes**  
**44.57% candidates**

14

## Finding Length-2 Sequential Patterns

- ▶ Scan database one more time, collect support count for each length-2 candidate
- ▶ There are 19 length-2 candidates which pass the minimum support threshold in our example DB
  - ▶ They are length-2 sequential patterns:  
 $\langle(a)(a)\rangle, \langle(a)(b)\rangle$   
 $\langle(b)(a)\rangle, \langle(b)(b)\rangle, \langle(b)(c)\rangle, \langle(b)(d)\rangle, \langle(b)(e)\rangle, \langle(b)(f)\rangle$   
 $\langle(c)(a)\rangle, \langle(c)(b)\rangle, \langle(c)(d)\rangle$   
 $\langle(d)(a)\rangle, \langle(d)(b)\rangle, \langle(d)(c)\rangle$   
 $\langle(f)(b)\rangle, \langle(f)(f)\rangle$   
 $\langle(bd)\rangle, \langle(bf)\rangle, \langle(ce)\rangle$

15

## Generating $C_k$ from $L_{k-1}$ ( $k > 2$ )

- ▶ Join step: generate  $C_k$  by joining  $L_{k-1}$  with  $L_{k-1}$ 
  - ▶ Rank all items in an itemset in an order.
  - ▶ A sequence  $s_1$  joins with  $s_2$  if the subsequence obtained by dropping the first item of  $s_1$  is the same as the subsequence obtained by dropping the last item of  $s_2$ .
  - ▶ The joined sequence is  $s_1$  plus the last item of  $s_2$ .
    - ▶ The added item becomes a separate element if it was a separate element in  $s_2$ , or part of the last element of  $s_1$  otherwise.
  - ▶ Examples:
    - ▶ Joining  $\langle(1)(2\ 3)(4)\rangle$  and  $\langle(2\ 3)(4)(5)\rangle$  produces  $\langle(1)\ (2\ 3)(4)(5)\rangle$
    - ▶ Joining  $\langle(1)(2\ 3)(4)\rangle$  and  $\langle(2\ 3)(4\ 5)\rangle$  produces  $\langle(1)(2\ 3)(4\ 5)\rangle$

16

## Generating $C_k$ from $L_{k-1}$ ( $k > 2$ ) (Cont'd)

- ▶ Prune step: delete candidates in  $C_k$  that have infrequent  $(k-1)$ -subsequence
  - ▶ A  $(k-1)$ -subsequence of sequence  $s$  is derived by dropping an item from  $s$
  - ▶ Check each  $(k-1)$ -subsequence against  $L_{k-1}$
  - ▶ Example:
    - ▶ If  $\langle (ab)(d) \rangle$ ,  $\langle (b)(ad) \rangle$ ,  $\langle (b)(de) \rangle$  are all length-3 frequent sequences, then
    - ▶ Join result:  $\langle (ab)(de) \rangle$
    - ▶ Its length-3 subsequences:
      - ▶  $\langle (b)(de) \rangle$ ,  $\langle (a)(de) \rangle$ ,  $\langle (ab)(e) \rangle$ ,  $\langle (ab)(d) \rangle$
    - ▶  $\langle (a)(de) \rangle$  and  $\langle (ab)(e) \rangle$  are infrequent,  $\langle (ab)(de) \rangle$  is pruned
    - ▶  $C_4$  becomes empty

17

## Generating $C_k$ from $L_{k-1}$ ( $k > 2$ ) (Cont'd)

- ▶ More Examples:
  - ▶ If  $\langle (a)(b) \rangle$ ,  $\langle (a)(a) \rangle$  and  $\langle (b)(a) \rangle$  are all length-2 sequential patterns, then length-3 candidates are:
    - ▶ Join result:
      - ▶  $\langle (a)(b)(a) \rangle$ ,  $\langle (a)(a)(b) \rangle$ ,  $\langle (a)(a)(a) \rangle$ ,  $\langle (b)(a)(b) \rangle$ , and  $\langle (b)(a)(a) \rangle$ .
    - ▶ After pruning:
      - ▶  $\langle (a)(b)(a) \rangle$ ,  $\langle (a)(a)(b) \rangle$ ,  $\langle (a)(a)(a) \rangle$ ,  $\langle (b)(a)(a) \rangle$ .
  - ▶ If  $\langle (bd) \rangle$ ,  $\langle (b)(b) \rangle$  and  $\langle (d)(b) \rangle$  are all length-2 sequential patterns, what are the length-3 candidates?
    - ▶ Join result:
      - ▶  $\langle (bd)b \rangle$ ,  $\langle (b)(bd) \rangle$ ,  $\langle (b)(b)(b) \rangle$ ,  $\langle (d)(bd) \rangle$ ,  $\langle (d)(b)(b) \rangle$
    - ▶ After pruning:
      - ▶  $\langle (bd)b \rangle$ ,  $\langle (b)(b)(b) \rangle$ ,  $\langle (d)(b)(b) \rangle$

18

## Example Continued

- ▶  $L_4$ : Length-4 sequential patterns:  $min\_sup\_count=2$

- ▶  $\langle (b)(c)(b)(a) \rangle$
- ▶  $\langle (bd)(b)(a) \rangle$
- ▶  $\langle (bd)(b)(c) \rangle$
- ▶  $\langle (bd)(c)(a) \rangle$
- ▶  $\langle (bd)(c)(b) \rangle$
- ▶  $\langle (bf)(b)(f) \rangle$
- ▶  $\langle (d)(c)(b)(a) \rangle$

Seq-id	Sequence
10	$\langle (bd)(c)(b)(ac) \rangle$
20	$\langle (bf)(ce)(b)(fg) \rangle$
30	$\langle (ah)(bf)(a)(b)(f) \rangle$
40	$\langle (be)(ce)(d) \rangle$
50	$\langle (a)(bd)(b)(c)(b)(ade) \rangle$

- ▶  $C_5$ : Length-5 candidates (after join and prune):

- ▶  $\langle (bd)(c)(b)(a) \rangle$

- ▶  $L_5$ : Length-5 sequential pattern (found by scanning DB):

- ▶  $\langle (bd)(c)(b)(a) \rangle$ : 2

19

## Summary of Simplified GSP

- ▶ Make the first pass over the sequence database D to find all the 1-element (length-1) frequent sequences
- ▶ Repeat until no new candidate or frequent sequences are found
  - ▶ **Candidate Generation:**
    - ▶ **Merge** joinable pairs of frequent sequences of length  $(k-1)$  to generate candidate sequences that contain  $k$  items
    - ▶ **Prune** candidate  $k$ -sequences that contain infrequent  $(k-1)$ -subsequences
  - ▶ **Support Counting and Candidate Elimination:**
    - ▶ Make a new pass over the sequence database D to find the support count for each candidate sequence
    - ▶ Eliminate candidate  $k$ -sequences whose actual support is less than  $min\_sup$

20

## Bottlenecks of GSP

- ▶ A huge set of candidates
  - ▶ 1,000 frequent length-1 sequences generate  $1000 \times 1000 + \frac{1000 \times 999}{2} = 1,499,500$  length-2 candidates!
- ▶ Multiple scans of database in mining
- ▶ Real challenge: mining long sequential patterns
  - ▶ An exponential number of short candidates
  - ▶ A length-100 sequential pattern needs  $10^{30}$  candidate sequences!

$$\sum_{i=1}^{100} \binom{100}{i} = 2^{100} - 1 \approx 10^{30}$$

21

## Better Method: PrefixSpan

- ▶ Generate all frequent sequences without candidate generation and testing.
- ▶ J. Pei et al. PrefixSpan: Mining sequential patterns efficiently by prefix-projected pattern growth. In Proc. of ICDE'01.
- ▶ Will talk about it next.

22

## PrefixSpan

- ▶ Generate all frequent sequences without candidate generation and testing.
- ▶ Strategy
  - ▶ Divide and conquer
    - ▶ Divide the patterns to be mined into subsets and find patterns in each subset recursively.
  - ▶ Projection-based
    - ▶ Recursively project a sequence database into a set of smaller databases based on the frequent “prefix” mined so far
    - ▶ Mine each projected database to find frequent “suffixes”

23

## Prefix and Suffix

- ▶ Suppose all the items in an element (i.e. an itemset) of a sequence are listed alphabetically.
- ▶ *Prefixes* of sequence  $\langle a(abc)(ac)d(cf) \rangle$  are  $\langle a \rangle$ ,  $\langle aa \rangle$ ,  $\langle a(ab) \rangle$ ,  $\langle a(abc) \rangle$ ,  $\langle a(abc)a \rangle$ ,  
... .
- ▶ *Suffixes* of sequence  $\langle a(abc)(ac)d(cf) \rangle$  :
  - ▶  $\langle (abc)(ac)d(cf) \rangle$  is the suffix wrt prefix  $\langle a \rangle$
  - ▶  $\langle (_bc)(ac)d(cf) \rangle$  is the suffix wrt prefix  $\langle aa \rangle$
  - ▶  $\langle (_c)(ac)d(cf) \rangle$  is the suffix wrt prefix  $\langle a(ab) \rangle$
  - ▶ ...

24

## Mining Sequential Patterns by Prefix Projections

- ▶ Step 1: find length-1 sequential patterns
  - ▶ <a>, <b>, <c>, <d>, <e>, <f>
- ▶ Step 2: divide search space. The complete set of freq. seq. can be partitioned into 6 subsets:
  - ▶ The ones having prefix <a>;
  - ▶ The ones having prefix <b>;
  - ▶ ...
  - ▶ The ones having prefix <f>

SID	sequence
10	<a(abc)(ac)d(cf)>
20	<(ad)c(bc)(ae)>
30	<(ef)(ab)(df)cb>
40	<eg(af)cbc>

min\_sup count=2

25

## Finding Freq. Seq. with Prefix <a>

- ▶ Only need to consider sequences containing <a>
- ▶ In a sequence containing <a>, only the subsequence (suffixes) prefixed with the first occurrence of <a> should be considered.
- ▶ The collection of such subsequences is called *<a>-projected database*:

<(abc)(ac)d(cf)>,  
 <(\_d)c(bc)(ae)>,  
 <(\_b)(df)cb>,  
 <(\_f)cbc>.

SID	sequence
10	<a(abc)(ac)d(cf)>
20	<(ad)c(bc)(ae)>
30	<(ef)(ab)(df)cb>
40	<eg(af)cbc>

min\_sup count=2

Next: recursively mine <a>-projected database to find frequent sequences in the projected database.

26

## Finding Freq. Seq. with Prefix <a> (Cont'd)

- ▶ Find local frequent length-1 sequences by scanning <a>-projected database
  - ▶ <a>-projected database: <(abc)(ac)d(cf)>, <(\_d)c(bc)(ae)>, <(\_b)(df)cb>, <(\_f)cbc> min\_sup count=2
  - ▶ Local frequent length-1 sequences:
    - <a>:2, <b>:4, <(\_b)>:2, <c>:4, <d>:2, <f>:2
- ▶ Generate all the length-2 freq. seq. having prefix <a>:
  - <aa>:2, <ab>:4, <(ab)>:2, <ac>:4, <ad>:2, <af>:2
- ▶ Further partition frequent sequences with prefix <a> into 6 subsets
  - ▶ Having prefix <aa>;
  - ▶ Having prefix <ab>;
  - ▶ ...
  - ▶ Having prefix <af>

27

## Finding Freq. Seq. with Prefix <aa>

- ▶ From <a>-projected database:
  - <(abc)(ac)d(cf)>, <(\_d)c(bc)(ae)>, <(\_b)(df)cb>, <(\_f)cbc>
- ▶ Generate <aa>-projected database:
  - <(\_bc) )(ac)d(cf)>, <(\_e)>
- ▶ No local frequent items, stop growing prefix <aa>.

min\_sup count=2

SID	sequence
10	<a(abc)(ac)d(cf)>
20	<(ad)c(bc)(ae)>
30	<(ef)(ab)(df)cb>
40	<eg(af)cbc>

28

## Finding Freq. Seq. with Prefix <ab>

- ▶ From <a>-projected database:  
    <(abc)(ac)d(cf)>, <(\_d)c(bc)(ae)>, <(\_b)(df)cb>, <(\_f)cbc>
- ▶ Generate <ab>-projected database:  
    <(\_c)(ac)d(cf)>, <(\_c)(ae)>, <c>
- ▶ Local frequent length-1 sequences
  - ▶ <a>:2, <c>:2, <(\_c)>:2
- ▶ Generate length-3 freq. seq. with prefix <ab>:
  - ▶ <aba>:2, <abc>:2, <a(bc)>:2
- ▶ Further partition the set of freq. Seq. prefixed with <ab>:
  - ▶ Sequences with prefix <aba>
  - ▶ Sequences with prefix <abc>
  - ▶ Sequences with prefix <a(bc)>

29

## Finding Freq. Seq. with Prefix <aba>

- ▶ From <ab>-projected database:  
    <(\_c)(ac)d(cf)>, <(\_c)(ae)>, <c>
- ▶ Generate <aba>-projected database:
  - ▶ <(\_c)d(cf)>, <(\_e)>
- ▶ No local frequent length-1 sequence, stop growing <aba>.

30

## Finding Freq. Seq. with Prefix <abc>

- ▶ From <ab>-projected database:  
    <(\_c) (ac)d(cf)>, <(\_c)(ae)>, <c>
- ▶ Generate <abc>-projected database:
  - ▶ <d(cf)>
- ▶ No local frequent length-1 sequence, stop growing <abc>.

31

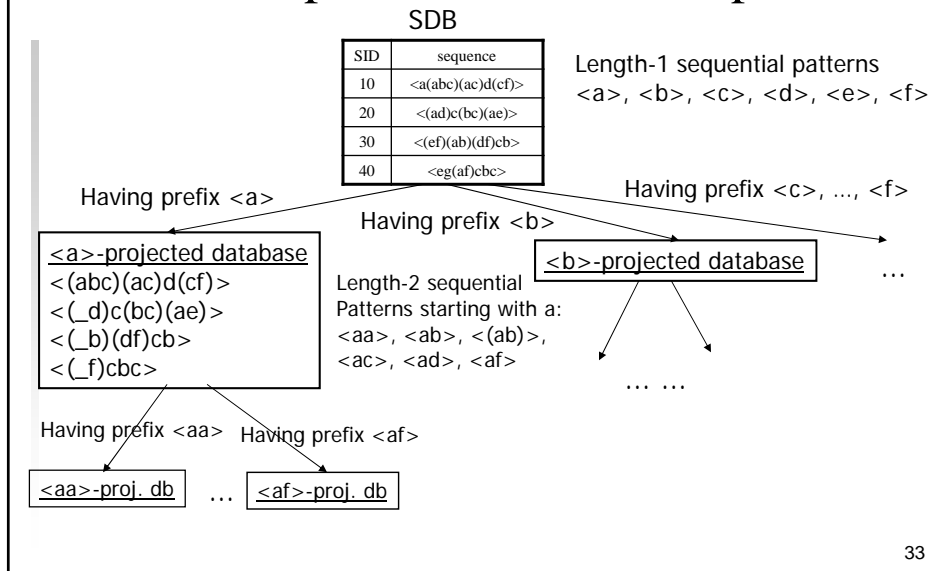

## Finding Freq. Seq. with Prefix <a(bc)>

- ▶ From <ab>-projected database:  
    <(\_c) (ac)d(cf)>, <(\_c)(ae)>, <c>
- ▶ Generate <a(bc)>-projected database:
  - ▶ <(ac)d(cf)>, <(ae)>
- ▶ Local frequent length-1 sequences:
  - ▶ <a>:2
- ▶ Generate length-4 freq. seq. with prefix <a(bc)>:
  - ▶ <a(bc)a>:2
- ▶ Further mining <a(bc)a>-projected database returns no frequent sequence prefixed with <a(bc)a>.
- ▶ This finishes generating all the patterns prefixed with <ab>.

32

## Completeness of PrefixSpan

## Efficiency of PrefixSpan

- ▶ No candidate sequence needs to be generated
- ▶ Projected databases keep shrinking
- ▶ Major cost of PrefixSpan:
  - ▶ constructing projected databases.
  - ▶ can be improved by *Pseudo-projections*

## Speed-up by Pseudo-projection

- ▶ Major cost of PrefixSpan: projection
  - ▶ Suffixes of a sequence often appear repeatedly in recursively projected databases

- ▶  $\langle (abc)(ac)d(cf) \rangle$  appears in  $\langle a \rangle$ -projected database
  - ▶  $\langle (\_c)(ac)d(cf) \rangle$  appears in  $\langle ab \rangle$ -projected database

- ▶ When (projected) database can be held in main memory, use pointers to form projections

- ▶ Pointer to the sequence

- ▶ Offset of the suffix

$s = \langle a(abc)(ac)d(cf) \rangle$   
 $\downarrow \langle a \rangle$   
 $s | \langle a \rangle : ( , 2) \langle (abc)(ac)d(cf) \rangle$   
 $\downarrow \langle ab \rangle$   
 $s | \langle ab \rangle : ( , 4) \langle (\_c)(ac)d(cf) \rangle$

35

## Pseudo-Projection vs. Physical Projection

- ▶ Pseudo-projection avoids physically copying suffixes
  - ▶ Efficient in running time and space when database can be held in main memory
- ▶ However, it is not efficient when database cannot fit in main memory
  - ▶ Disk-based random accessing is very costly
- ▶ Suggested Approach:
  - ▶ Integration of physical and pseudo-projection
  - ▶ Swapping to pseudo-projection when the projected database fits in memory

36

## Experiments and Performance Analysis

- ▶ Comparing PrefixSpan with GSP, FreeSpan and SPADE in large databases
  - ▶ GSP (IBM Almaden, Srikant & Agrawal EDBT'96)
  - ▶ FreeSpan (J. Han J. Pei, B. Mortazavi-Asi, Q. Chen, U. Dayal, M.C. Hsu, KDD'00)
  - ▶ SPADE (Zaki, 01)
- ▶ PrefixSpan is fastest and scalable.

37

## Problem of Sequential Pattern Mining

- ▶ GSP and PrefixSpan finds all the sequences that satisfy the support threshold.
- ▶ A long frequent sequence contains a combinatorial number of frequent subsequences:
  - ▶ For a length-100 sequential pattern, there exist  $2^{100}-1$  nonempty subsequences.
- ▶ Problem: too many patterns are generated.

38

## Solutions

- ▶ Mining maximal or closed sequential patterns
  - ▶ Maximal sequential pattern:
    - ▶ A frequent sequence  $s$  is *maximal* if there exists no frequent super-sequence of  $s$ .
  - ▶ Closed sequential pattern:
    - ▶ A sequence  $s$  is *closed* if there exists no super-sequence of  $s$  with the same support as  $s$ .
    - ▶ *CloSpan* (Yan, Han and Afshar, 2003): an efficient closed sequential pattern mining method.

39

## Solutions (Cont'd)

- ▶ Constraint-based mining of sequential patterns
  - ▶ Constraints
    - ▶ Item constraint
      - ▶ Find patterns containing a, b, c, but no d.
    - ▶ Length constraint
      - ▶ Find patterns having at least (or at most) 10 items
    - ▶ Super-pattern constraint
      - ▶ Find patterns that contain  $\langle \text{PC} \rangle \langle \text{Digital-camera} \rangle$
    - ▶ Aggregate constraint
      - ▶ Find patterns the average price of whose items is over \$100.

40

## Solutions (Cont'd)

- ▶ More constraints
  - ▶ Regular expression constraint
    - ▶  $\langle a^* \{bb|(bc)d|dd\} \rangle$
  - ▶ Duration constraint
    - ▶ Find patterns of events about  $\pm 24$  hours of a shooting
  - ▶ Gap constraint
    - ▶ Find purchasing patterns such that the gap between each consecutive purchases is less than 1 month.

41

## Solutions (Cont'd)

- ▶ Properties of constraints
  - ▶ Anti-monotonic constraint
    - ▶ If a sequence  $s$  satisfies constraint  $C$ , so does every non-empty subsequence of  $s$
    - ▶ Examples:  $\text{support}(s) \geq 5\%$ ,  $\text{length}(s) < 10$
  - ▶ Monotonic constraint
    - ▶ If a sequence  $s$  satisfies constraint  $C$ , so does every super sequence of  $s$ .
    - ▶ Examples:  $\text{length}(s) \geq 10$ , super pattern constraints.
- ▶ A systematic study on constraint-based sequential pattern mining:
  - ▶ J. Pei, J. Han, and W. Wang. "[Mining Sequential Patterns with Constraints in Large Databases](#)". In *Proceedings of CIKM'02*.

42

## More Recent Research on Frequent Pattern Mining

- ▶ Mining other kinds of frequent patterns
  - ▶ Frequent tree/graph mining
    - ▶ Find common structural components
  - ▶ Examples of applications
    - ▶ XML documents can be modeled as trees
    - ▶ Molecule or biochemical structures can be modeled as graphs
    - ▶ Web connection structures can be modeled as graphs
- ▶ Finding frequent patterns from data streams
  - ▶ Only one scan of DB is allowed.

43

## More Recent Research on Frequent Pattern Mining (Cont'd)

- ▶ Finding high-utility patterns (either itemsets or sequences)
  - ▶ Consider the quantity of the item inside a transaction.
  - ▶ Consider the importance (e.g., price) of an item
  - ▶ Find patterns whose revenue is at least, e.g., \$1000

44

## Frequent Pattern Mining Resources

- ▶ Web site: <http://fimi.cs.helsinki.fi/> contains some frequent itemset mining implementations, datasets and papers.
- ▶ SPMF: open-source data mining library containing frequent sequence and itemset mining:  
<http://www.philippe-fournier-viger.com/spmf/>

45

## Next Class

- ▶ Decision tree learning (Sections 8.1 and 8.2 in Chapter 8)
